

ammonia (NH3), which is a colorless gas with a strong, pungent odor. It is highly soluble in water, forming ammonium hydroxide. Ammonia is commonly used in agriculture as a fertilizer and in industry for various chemical processes. It is also found in nature, produced by certain bacteria and in volcanic emissions. Ammonia is a key component in the production of many chemicals, including fertilizers, explosives, and pharmaceuticals. Its use in industry is extensive, particularly in the production of nitric acid and urea. Ammonia is also used in the food industry for the production of certain food additives and in the textile industry for the production of dyes and fabrics. The handling and storage of ammonia require special precautions due to its corrosive and toxic properties. It is important to use proper safety measures when working with ammonia to avoid health and environmental hazards.
